

AVMetrics Completes Technology Infrastructure Upgrade

Simi Valley, CA - January 20, 2009 – AVMetrics, LLC, a leading provider of AVM test and validation services, has completed a major upgrade to its technology infrastructure improving the reliability and redundancy of the computer and network systems utilized in the company's national testing of Automated Valuation Models.

The upgrade consisted of three major efforts:

- Relocated the AVMetrics' data center to a hardened facility near the Internet's main peering point for the west coast
- Fully meshed OC192/10gb fiber network with AT&T, LEVEL3, XO, and COGENT
- Installed new, state-of-the-art servers

The upgrade of these major technology components allow AVMetrics to meet the most stringent requirements for security and redundancy required by its clients and position the company to accommodate the ever-increasing amount of data used in its quarterly analysis of AVM performance.

"The upgrades to our technology systems allow us to easily handle the growing data requirements of our company and meet the analytical needs of our clients as they look to us for more sophisticated analysis of the AVMs in the market today", according to Lee Kennedy, President and CEO.
